2.2 Health, fitness and training

Basal Metabolic Rate

Fats

Carbohydrates

Vitamins

Energy use, diet, nutrition and hydration

Energy Balance

Minerals

Proteins

Water

Fibre

Energy use, diet, nutrition and hydration

1. Basal metabolic rate

The rate at which we burn calories for energy is called our **basal** _____ **rate**.

- ▶ Physical activity can _____ our basal metabolic rate so we need to consume more calories.
- ▶ When we eat is also important.
- ▶ Ensure you leave at least **two** hours after and before exercise.
- ▶ During exercise you can consume _____ quantities that are easily digested.
- ▶ After activity you should consume plenty of _____ and after a period a balanced meal.

2. Energy

Average females need **2,000 Kcal/day** and males need **2,500Kcal/day**. This may vary depending on the following factors:

- ▶ _____ need more energy than young **children**.
- ▶ _____ tend to need more energy than **females**.
- ▶ _____ need more energy than **non-athletes**.
- ▶ People with _____ lifestyles need more energy than people with **non-active** lifestyles.
- ▶ _____ people need more than **shorter** people.

Energy use, diet, nutrition and hydration

To maintain **energy** _____ the food intake needs to match energy needs.

An increase in energy intake can result in **weight** _____.

An increase in energy needs without an increase in energy intake will result in weight **loss**.

Energy is derived from food sources:

- ▶ **muscle cells** release energy from glucose in a process called _____.
- ▶ some glucose is converted to _____ and **stored** in the muscles and liver.

3. Nutrients

- ▶ The body needs a **balanced diet** as unused calories are stored as fat and nutrients are needed for growth and hydration.

- ▶ _____
- ▶ _____
- ▶ _____
- ▶ _____
- ▶ _____
- ▶ _____
- ▶ _____

4. Carbohydrates

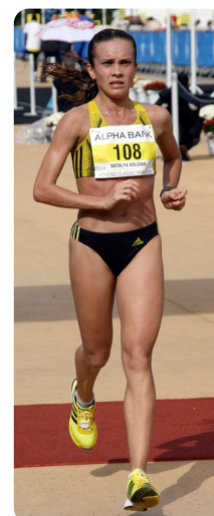

Why are they important?

- ▶ Provides the most ready source of _____ **for cell respiration**.
- ▶ Allows the athlete to perform for longer and is used for _____ events such as cycling and marathon running.

Sources of food

- ▶ Bread, rice, pasta and potatoes.

Useful sources of energy

Energy use, diet, nutrition and hydration

- ▶ Over _____ **of our energy needs** are taken from carbohydrates, athletes need even more.

Carbohydrate loading is a technique used by endurance athletes to maximise their carbohydrate stores.

- ▶ This involves eating _____ **carbohydrate meals** 24 hours before the day of the competition.
- ▶ This helps maximise the **glycogen stores**.
- ▶ One downside is this can leave the performer feeling heavy and sluggish.
- ▶ It should, however, _____ the effects of fatigue.

5. Protein

Why are they important?

- ▶ They build _____ tissues to make the body stronger.
- ▶ They **repair** muscle tissue.

Sources of food

- ▶ Meat, eggs and nuts.

Useful sources of energy

- ▶ Protein provides a **small amount of** _____ if needed.

Power and strength athletes need to build muscle.

- ▶ To assist them they combine training with a _____ **protein diet**.
- ▶ A high protein diet is also used during the _____ from an injury.
- ▶ This kind of diet can also help athletes who need to **lose** _____.
- ▶ Many power athletes will also consume protein _____.

6. Fats

Why are they important?

- ▶ Provides large amounts of _____.
- ▶ They contain essential **fatty** _____ that the body needs to function.
- ▶ Insulates the body against the cold.

Sources of food

- ▶ Butter, cheese, ice cream, fatty meats and oil.

Useful sources of energy

- ▶ Fats provide _____% of our energy needs.
- ▶ They can only be used at low intensities when oxygen is in **plenty** supply.

7. Vitamins and minerals

Why are they important?

- ▶ **Aid** _____.
- ▶ Boost our _____ system.
- ▶ Regulate body functions.

Sources of food

- ▶ Vegetables and fruit.

Useful sources of energy

- ▶ Vitamins and minerals do **not** generate any energy.

8. Water

Why is it important?

- ▶ Water balance prevents _____.

Energy use, diet, nutrition and hydration

Dehydration causes:

- ▶ Blood plasma is made up of mostly water so without it the blood will _____ and slow blood flow.
- ▶ Blood thickening causes increased **heart rate** and irregular heart beat.
- ▶ Causes an increase in temperature and _____.
- ▶ Slows _____ and decision making.
- ▶ Increase in muscle _____ and cramps.

Sources of food

- ▶ Water can be found in most food and drink products but the best way to hydrate is to drink it directly.

Useful sources of energy

- ▶ Water provides **no** energy but it does aid the chemical reactions that release energy.

9. Fibre/roughage

Why is it important?

- ▶ It pushes your food along your _____ preventing constipation.
- ▶ It absorbs _____ wastes from digested foods.
- ▶ Makes you feel full.

Sources of food

- ▶ Fruit, vegetables, bread and cereals.

Useful sources of energy

- ▶ Fibre is **not** a source of energy.
